Gen AI Documentation

Date Used: March 22, 2026

Tool disclosure: AI Agent on Visual Studio Code (CoPilot)

Purpose of Use: To use AI as a coding tool to update my game's debug menu. I used it to help generate and revise code for the menu options so I could make the game easier to test and adjust.

Summary of Interaction: I used Copilot in Visual Studio Code to update the game by adding a debug menu. I prompted it to include options for changing ball speed, toggling music/sound, and changing platform size.

Human Decision Points:

- Decided to add a debug menu to help test and adjust the game more easily.
- Chose to include ball speed controls, sound toggles, music toggles, and platform size controls.
- Removed the pause button from the menu and kept pausing as a keyboard control instead.
- Removed the reset score button because it was unnecessary.
- Changed the label from "debug screen" to "debug menu" to better match the final design.
- Kept the menu underneath the game instead of making it a pop-up because I liked how it looked and it felt more practical than a floating icon.

Scope of GenAI Use: GenAI was used to update the code for the debug menu. GenAI was not used to write any of the project descriptions, reflections, or Read Me content.

Limitations or Misfires:

- I originally expected the debug menu to appear as a pop-up icon, but it was placed underneath the main game instead.
- The layout required scrolling, which was different from what I first imagined.
- Some prompt changes were needed to remove buttons I no longer wanted, such as pause and reset score.

Summary of Process (Human + Tool)

- Prompting and iteration
- Playtesting

- Reviewing layout

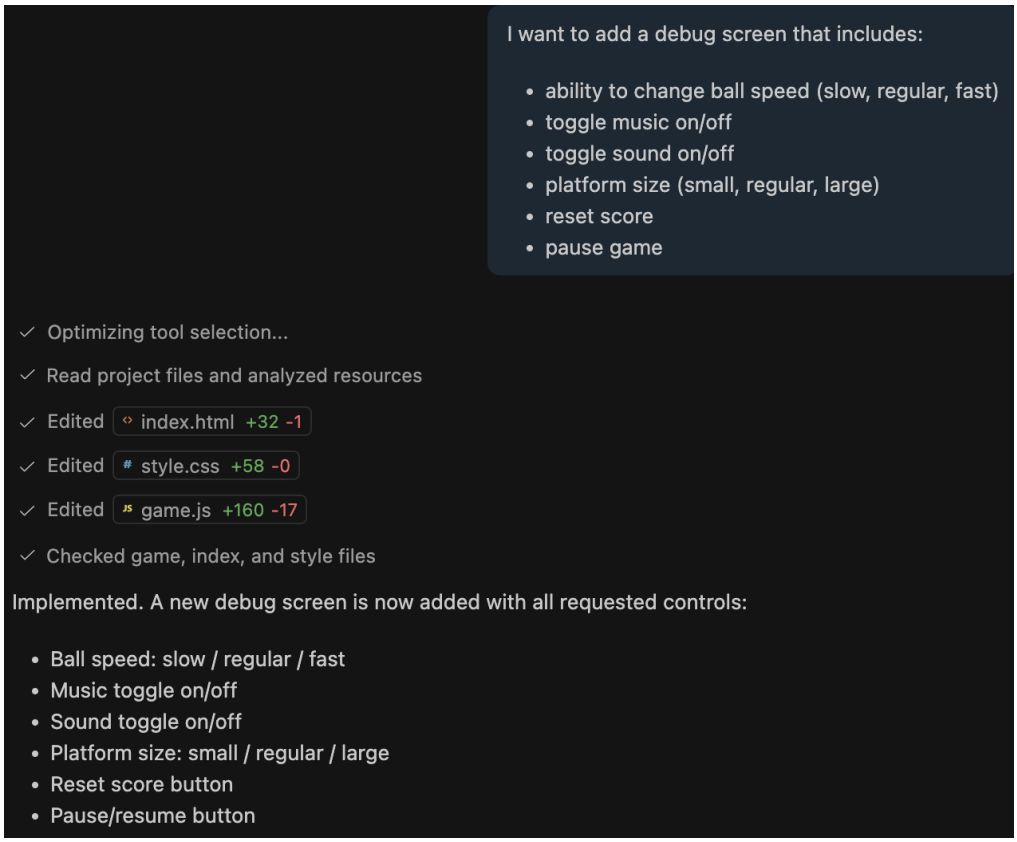
Decision Points & Trade-offs

- I chose to keep the debug menu under the game even though it wasn't my original plan.
- I decided that a visible section below the game was still a good design choice because it was easy to read and fit the overall layout.
- I kept the menu simple so it stayed useful without adding extra clutter.

Verification & Judgement

I checked the updated game to make sure the debug menu options matched what I wanted. I reviewed the layout, confirmed that the pause and reset buttons were removed, and made sure the menu reflected the final version I intended to use.

APPENDIX



Updated files:

- index.html
- style.css
- game.js

Notes:

- P key now also toggles pause/resume.
- Audio file paths were corrected to use the Audio folder in game.js .

remove the pause game button in the debug screen, keep the "press p to pause"

- Read HTML and JavaScript files
- Edited index.html +0 -1
- Edited game.js +0 -14
- Checked game.js and index.html files

Done. I removed the pause button from the debug screen and kept keyboard pause with P.

Updated:

- index.html
- game.js

Press P to pause remains in the hint text and pause/resume still works via the keyboard.

remove the reset score button

- Read HTML and JavaScript files
- Edited index.html +0 -3
- Edited game.js +0 -10
- Checked HTML and JavaScript files

Done. I removed the Reset Score button and cleaned up its logic.

Updated:

- index.html
- game.js

replace "debug screen" with debug menu"

- Searched for regex patterns in code
- Edited index.html +1 -1

Done. I replaced it with “Debug Menu” in index.html .
